

# **Docker Journal**

Zainul Malik

## Introduction

This is a tutorial and outline of the steps I followed to complete this bonus assignment. It will take you through all the steps that you need to complete challenge 1 and challenge 2 outlined in the assignment document. Along with this, I will provide helpful references, screenshots, and general tips that you can use to learn how to use Docker to deploy both static and dynamic web applications.

## Prerequisites

Before you start, ensure you have the following installed on your computer:

- **Git:** For version control and cloning repositories.
- **Docker:** The main tool for creating, deploying, and running containers.
- **GitHub Account:** For hosting your project code and Dockerfiles.
- **Visual Studio Code:** A versatile code editor by Microsoft for Windows, macOS, and Linux.

## Download Links

These are the download links for the above programs:

- **Git:** <https://git-scm.com/downloads>
- **Docker:** <https://www.docker.com/products/docker-desktop/>
- **GitHub Account:** <https://github.com/>
- **Visual Studio Code:** <https://code.visualstudio.com/>

## Helpful Links

These are some helpful links I used to complete the challenges, and may be helpful for you as well.

- **Docker Docs:** <https://docs.docker.com/get-started/>
- **Creating a Dockerfile & Docker Image for HTML Application:**  
<https://youtu.be/UXAoZg1W3Q4?si=oriYwvfmHE6OVC5l>
- **NGINX + Docker:** <https://youtu.be/prn68HXjlwQ?si=ql9ceDd3x-Ca8CP3>
- **Understanding Docker Networking:**  
<https://www.docker.com/blog/understanding-docker-networking-drivers-use-cases/>

## Getting Started

1. **Fork the Project Repository:** Visit <https://github.com/eduluz1976/docker-challenge-template> and fork the repository to your GitHub account. Keep the forked repository public.
2. **Clone the Repository:** Open your terminal and clone the forked repository to your local machine using:
  - a. `git clone <repository-url>`
  - b. Replace `<repository-url>` with the URL of your forked repository.

## Challenge 1: Deploy a Static Web Page

### Setup Your Project Directory

1. Inside `docker-challenge-template`, create a directory for the first challenge using the command below if not already created in the template: `mkdir challenge1`.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template>mkdir challenge1
```

2. Navigate into this directory: `cd challenge1`.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template>cd challenge1
```

3. Inside `challenge1`, create a `public` directory: `mkdir public`.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1>mkdir public
```

### Create Your Static Web Page

1. Navigate into the `public` directory: `cd public`.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1\public>
```

2. Open the `challenge1` folder in Visual Studio Code and create an `index.html` file by clicking the new file button:

3. Add the following code to your index.html file and replace [Your Name] and [Your Student ID] with your actual name and ID.

```
challenge1 > public > <> index.html > ...
1  <!DOCTYPE html>
2  <html lang="en">
3  <head>
4      <meta charset="UTF-8">
5      <meta name="viewport" content="width=device-width, initial-scale=1.0">
6      <title>My Static Page</title>
7  </head>
8  <body>
9      <h1>Hello, World!</h1>
10     <p>My name is [Your Name] and my student ID is [Your ID] .</p>
11 </body>
12 </html>
13
```

## Dockerize Your Application

1. Return to the challenge1 directory: `cd ..`

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1\public>cd ..
```

2. Create a Dockerfile: `touch Dockerfile`.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1>touch Dockerfile
```

3. Open the Dockerfile in Visual Studio Code and insert the following:

```
challenge1 > Dockerfile > ...
1  # Use official image of NGINX
2  FROM nginx:alpine
3
4  # Copy static assets into the NGINX server
5  COPY ./public /usr/share/nginx/html
6
7  # Expose port 80
8  EXPOSE 80
9
10 # Start NGINX
11 CMD ["nginx", "-g", "daemon off;"]
12
```

4. Save and close the Dockerfile.

## Build and Run Your Docker Container

1. In the **challenge1** directory, build your Docker image: **docker build -t webserver-static .**

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1>docker build -t webserver-static .
```

2. Run your container: **docker run -d -p 8080:80 webserver-static.**

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1>docker run -d -p 8080:80 webserver-static
```

3. Open a web browser and navigate to **http://localhost:8080**. You should see your static page.

4. Your page should look similar to the page below with your **name** and your **id**.

## Documentation

1. Take a **screenshot** of your browser displaying the **static page**.
2. Take a **screenshot** of your **terminal** showing the last build and run commands.
3. Using a **text editor** such as Word or Google Docs, **write down the steps** you went through to achieve your results.

## Challenge 2: Deploy a Dynamic NodeJS Application

### Prepare Your Application Files

1. Navigate back to the root directory: `cd ..`

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge1>cd ..|
```

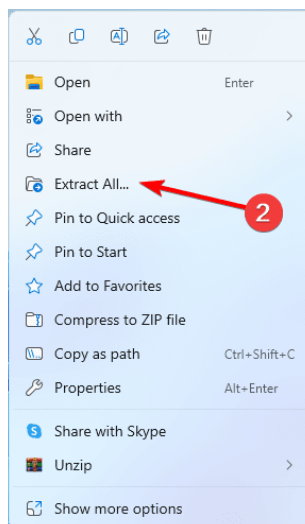

2. Create a directory for the second challenge: `mkdir challenge2` (if it is not already created from the template).

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template>mkdir challenge2|
```

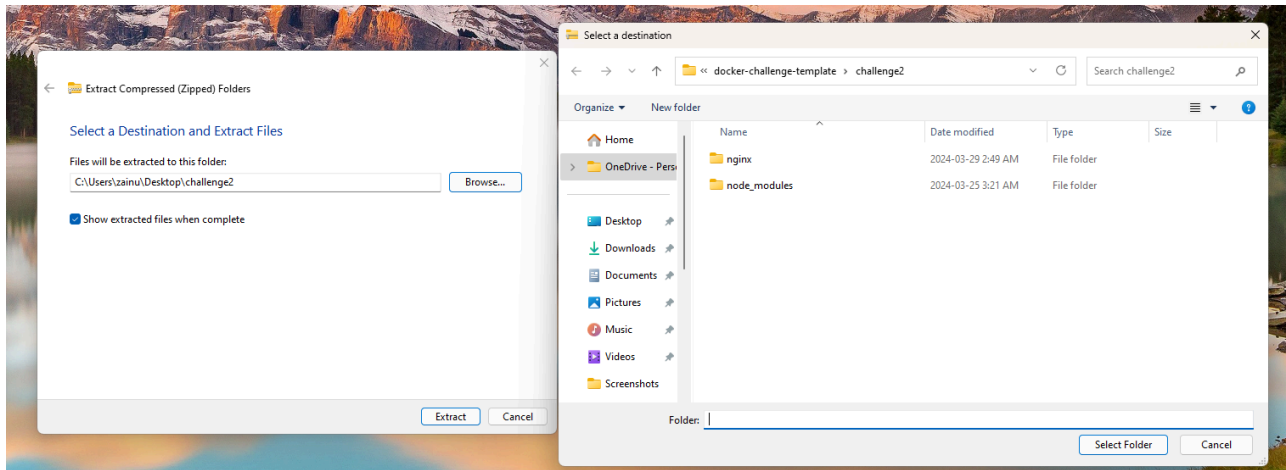

3. Navigate into it: `cd challenge2`

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template>cd challenge2
```

4. Unzip the provided `challenge2.zip` file into this directory by clicking extract all.

- After clicking extract all, click the browse button and select the challenge2 folder. Then click the extract button to extract all the files from the **challenge2.zip** folder to your **docker-challenge-template/challenge2** folder.

- Now the following files should be in your **docker-challenge-template/challenge2** folder directory.

Name	Date modified	Type	Size
nginx	2024-03-29 2:49 AM	File folder	
node_modules	2024-03-25 3:21 AM	File folder	
.gitignore	2024-03-25 2:10 AM	Git Ignore Source ...	0 KB
docker-compose.yml	2024-03-29 2:49 AM	Yaml Source File	1 KB
Dockerfile	2024-03-29 3:06 AM	File	1 KB
package.json	2024-03-25 3:20 AM	JSON Source File	1 KB
package-lock.json	2024-03-25 3:21 AM	JSON Source File	25 KB
server.js	2024-03-25 3:20 AM	JavaScript Source ...	2 KB

## Dockerize the NodeJS Application

1. Inside **challenge2**, create a Dockerfile: **touch Dockerfile**.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge2>touch Dockerfile
```

2. Open the **Dockerfile** in Visual Studio Code and write the following code:

```
challenge2 > Dockerfile > ...
1
2 FROM node:14
3
4
5 WORKDIR /usr/src/app
6
7
8 COPY . .
9
10
11 RUN npm install
12
13
14 EXPOSE 3000
15
16
17 ENV PORT 3000
18
19
20 CMD ["node", "server.js"]
21
```

3. Save and close the Dockerfile.
4. In the challenge2 directory, create a **docker-compose.yml** file: **touch docker-compose.yml**.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge2>touch docker-compose.yml
```

5. Open **docker-compose.yml** in Visual Studio Code and insert the following: (Make sure NGinx is listening on port 8080)

```
challenge2 > docker-compose.yml
1 version: '3'
2 services:
3   app:
4     build: .
5     volumes:
6       - ./usr/src/app
7
8   nginx:
9     image: nginx:alpine
10    depends_on:
11      - app
12    volumes:
13      - ./nginx/default.conf:/etc/nginx/conf.d/default.conf
14    ports:
15      - "8080:80"
16
```

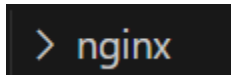

6. Save and close the **docker-compose.yml**.

- Open visual studio code, and in the **challenge2** folder click the **new folder** button:

- Name it **"nginx"**

- Create a **default.conf** file inside the nginx folder, using the new file button shown earlier in **challenge1** and insert the following code.

```
challenge2 > nginx > default.conf
1  server {
2      listen 80;
3
4      location /api/ {
5          proxy_pass http://app:3000/;
6          proxy_http_version 1.1;
7          proxy_set_header Upgrade $http_upgrade;
8          proxy_set_header Connection 'upgrade';
9          proxy_set_header Host $host;
10         proxy_cache_bypass $http_upgrade;
11     }
12 }
```

## Build and Run Your Application

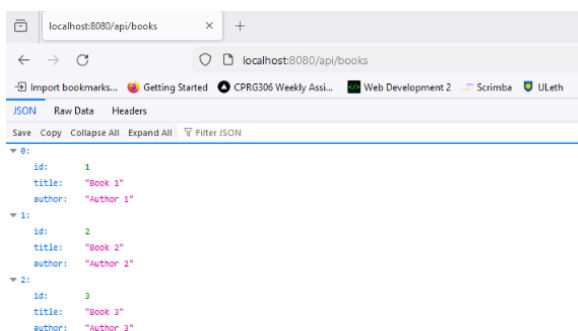

- Build and start your application with Docker Compose: **docker-compose up --build** in the **challenge2** directory.

```
C:\Users\zainu\Desktop\OS_BONUS_ASSIGNMENT\docker-challenge-template\challenge2>docker-compose up --build
```

- Open a web browser and navigate to <http://localhost:8080/api/books> first

- This is what your page should look like:

- Now open a web browser and navigate to <http://localhost:8080/api/books/1>.

- You should see this **output** on your page:

## Documentation

- Take a screenshot of your browser displaying the dynamic application.
- Take screenshots of your terminal showing the Docker Compose commands and output.
- Using a **text editor** such as Word or Google Docs, **write down the steps** you went through to achieve your results.
